Spreading electric vehicles and natural energy to the world

Issues including global warming, energy problems, and PM2.5 (fine particulate matter) have become a threat on a global scale. There is an urgent need for the global spread of electric vehicles and natural energy if we are to drastically resolve these issues.

To realize this, we will propose methods to spread the ultimate electric vehicle technology and natural energy beyond imagination, and apply them into practice. Based on the outcomes of technological developments such as the high performance electric vehicle Eliica, we will realize our purpose through consulting, new technology development and commercialization.
