

PANAC パナック株式会社

Cosmetics made from sustainable microalgae. Research and development of functional natural material aimed specifically the development of quasi-drugs.

Panac Ltd. Algae enterprise project is continuing to develop and research the functional matter that can be produced and extracted from 10 microns of small algae (microalgae). Our companies original materials, especially purekuran (cytoplasm from a parachlorella kessleri cell), are used amongst many manufacturing companies as the base for both the development of cosmetics and quasi-drugs.

We believe that as a foundation for creating a low carbon society, we should first become resourceful and effectively recycle and make full use of our waste products. Please very much expect that Panac Ltd. Algae enterprise project will soon achieve this goal.
